# Generator Hookup Solutions

**You've bought the generator...**

**Now how should I hook it up?**

## The OPTIONS

### Dryer Hookup

A dangerous hook-up that utilizes the existing dryer outlet in your house to back-feed the remaining portion of your panel. It offers no protection for your generator or home. It also endangers utility crews.

**CHEAP  
DANGEROUS  
ILLEGAL**

### Transfer Switch Kit

A hookup that combines the safety of a transfer switch with an EM panel, which allows only pre-determined circuits to be used during an emergency. It is simple, but also limited by generator size.

**LIMITED  
NOT UPGRADABLE  
INFLEXIBLE  
\$900-1800**

### Plug 'N Play Home System

**A easy hookup that allows you to safely choose and operate any combination of circuits in your house (within the capacity of your generator). Its transfer switch is designed for 7500 watt to 25kW generators, which allows for future expansion.**

**BEST VALUE  
EXPANDABLE  
SAFEST**

## The PACKAGE

House Plug N Play Systems include:

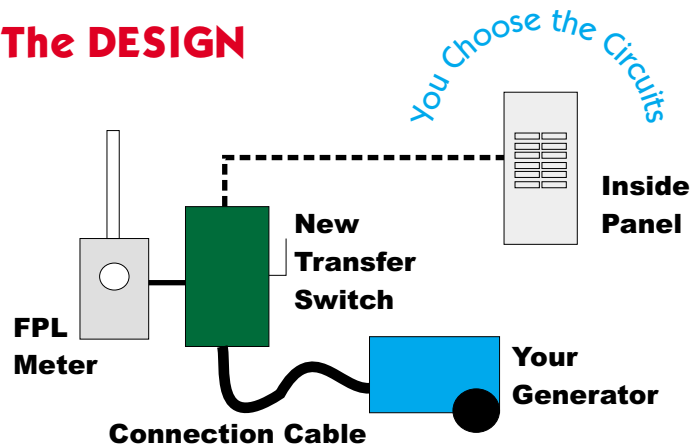

- ( 1 ) 200amp spec grade manual outdoor transfer switch
- ( 2 ) Built-in 30, 50 or 100amp receptacle for connection to generator
- ( 3 ) 15' of cable and cord caps from generator to switch
- ( 4 ) Training and test run
- ( 5 ) Free enrollment in Wesworth Storm Solutions Program

# \$1650

Most applications

## The DESIGN

The Transfer Switch is installed outside next to the FPL Meter. During normal power, electricity flows through the switch and powers your inside panel. During emergencies, you turn your generator on and activate the switch which will power your panel. You must turn your panel breakers on and off to adjust to the capacity of your generator.
